WHAT IS QUICKSILVER HERBICIDE?

QuickSilver is a rapid-acting, post-emergent, contact herbicide that provides quick knockdown as a tank mix partner in combination with other herbicides. QuickSilver provides improved efficacy compared to the broadleaf weed herbicide alone. An applicator is also able to reduce the rate of their broadleaf weed herbicide. QuickSilver acts very rapidly; activity is observed within a few hours after application. This formula gives your tank mix a boost, providing visible results within 24 hours.

HOW DOES QUICKSILVER HERBICIDE WORK?

QuickSilver is a protox inhibitor, which induces the formation of peroxides that attacks lipids in the cell membrane. This disruption causes leakage of cell contents resulting in cell destruction. With this formulation, plants become necrotic within hours after treatment. Quicksilver can be used on turf with 3-way herbicides, as well as other types of broadleaf herbicides.

QUICKSILVER HERBICIDE:

- Rainfast within 1 hour
- Works fast on target broadleaf weeds- 24-48 hours after application
- Highly effective under cool and warm environmental conditions

WEEDS CONTROLLED

AS A TANK MIX PARTNER:

- Dandelion
- Dayflower
- White Clover
- Wild Violet
- Ground Ivy
- Henbit

LABELED USE SITES:

- Residual Lawns
- Institutional Lawns
- Golf Courses
- Industrial Buildings

GENERAL USE NOTES

QuickSilver® Herbicide is a contact herbicide with little or no residual activity that provides selective postmergence control of broadleaf weeds. This formulation rapidly penetrates into the plant cell walls and will show visual symptoms on susceptible weeds in 24 hours or less. QuickSilver is rainfast within one hour after application.

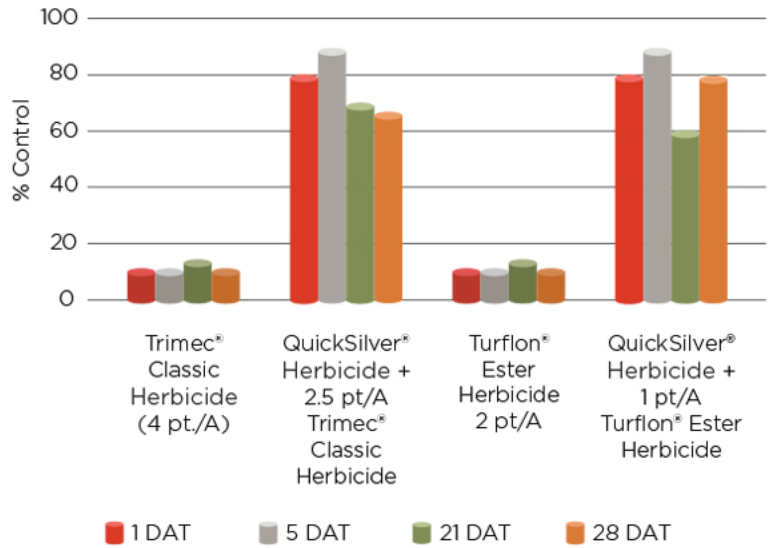

APPLICATION GUIDELINES:

- Most effective when applied to actively growing winter and summer annuals.
- Increases the speed of kill and expands the spectrum of control of broadleaf weeds when applied in a tank mixture with other postmergence herbicides.
- Product remains highly effective under both cool and warm temperatures.
- Can be applied to most turf types* 7 days or more after emergence for species established by both seeding and sprigging.

* Consult label for all listed turf species
